This lesson was created by a teacher participating in a Wisconsin ESEA Improving Teacher Quality grant entitled Inquiry Based Technology-Mediated Teacher Professional Development and Application.

Title: Filling in the Picture
Submitted by: Cheryl Awtrey
Grade Level: With some minor changes, this lesson could be used with any grade level./

Subjects: Science, Social Studies, Math
Objectives: By planning what parts of a site to excavate and participating in the follow-up reading and discussion students will:

1. Discover some of the problems inherent in choosing sites and what parts are chosen for excavation.
2. Evaluate and explain their choices for study.
3. Articulate the process of archaeological research at a basic level.

WI Standards: $\quad$-Science A.8.3, B.8.3, C.8.4, C.8.6
-Social Studies B.8.4
-Math C.8.5

Duration: One class period (40-45 minutes)
Materials/Supplies: -10 x 6 grid with row and column labels (enough for 2 copies per student)
-Completed map and diagram for teacher
-Copy of "Current Science" magazine
-Observations worksheet for each student
Vocabulary: -Site - A geographic place where there is evidence of past human activity.
-Hammerstone - The stone used to strike a core in order to detach flakes.
-Pot sherd - piece of broken pottery
-Midden - A surface used for trash disposal, often characterized by a dark stain or an accumulation of debris.
-Unit - A defined horizontal area that will be systematically excavated, such as a 2 X 2 meter square.
-Core - The parent stone material from which flakes are struck.
-Flakes - The pieces of stone struck off a rock in the reduction sequence
(flintknapping), each usually having a striking platform, bulb of percussion, and similar identifying features.
-Flint knapping - The process of chipping stone into shapes usable as tools or for expressive purposes.

Background: Archaeology is all about recreating something from the past based on the evidence. Because of the constraints of time and money, it is usually not practical for an archaeologist to excavate all of a site. Indeed, one of the more difficult tasks is to decide what parts of a site to explore thoroughly. Thanks to movies, television, and books most individuals know a little about the process of archaeology. Seldom do such popular works deal with the preliminary tasks of selecting a site and sifting through the material to begin to see where it might be best to investigate. Further, most individuals outside of the field do not realize the tremendous amount of history that is lost to development of roads and businesses.

Setting the Stage: Use the Mystery Photos page from the "Current Science" magazine. Have students try to guess what is in the picture so that they begin to see that how you look at an object or what part of an object you see influences how you interpret it.

Procedure: 1. Put a large copy of the $10 \times 6$ grid on the board or overhead. Explain to students that this area represents a native site in south central Wisconsin. As archaeologists, they have the time and money to explore only 25 (or one for each student in your class) sections of the site. They need to choose which sections they want to investigate. You can have the class work all together or in small groups to decide which sections to excavate. 2. Reveal the selected section contents. Have the students describe as much as they can about the site using the information given. This can be done orally as a group or as individuals in writing.
3. Announce that the group has just received a very generous grant allowing them to double the number of sections excavated. Have the students again select which sections to excavate.
4. Reveal the selected section contents. Have the students describe as much of the site as they can using this new information. Be sure to have them explain how the additional information changed their interpretation.

Closure: As a group, discuss the different interpretations made by the differing choices the group made. (If this lesson is undertaken in more than one class, it might be interesting to have students compare their results with those of another group.) Help students to reflect on the amount of historical information that has been lost through construction and agricultural processes.

Evaluation: Have students turn in their sheets explaining what they understand about the culture at each step and how their interpretations changed as
information was added.
Links/Extension: 1. Art or technical education teachers may want to be a part of this activity since both often use grids in the reproduction of information.
2. Intrigue of the Past: A Teacher's Guide for Fourth through Seventh Grades - Lesson 9: Gridding a Site
