Mississippi Valley Archaeology Center 1725 State Street

The following lessons were created by Jonathan Halabi, a teacher participating in the National Endowment for the Humanities Summer Institute for Teachers entitled Touch the Past: Archaeology of the Upper Mississippi River Region.

Any views, findings, conclusions or recommendations expressed in this publication do not necessarily represent those of the National Endowment for the Humanities.

## Three Dimensional Coordinates

| Grade Level | A |
| :--- | :--- |
| Subjects | Algebra |
| Duration | 1 enrichment lesson |
| Unit | Graphing on the Cartesian Plane |
| Vocabulary | Origin, x-axis, y-axis, north, south, east, west, up, down, below |
| Background 1 | Students have studied archaeology in conjunction with 1) the <br> development of man (in Global History), 2) river societies (in Global <br> History) and 3) the first peoples of the Americas (in United States <br> History), all earlier in the term |
| Background 2 | Students have completed all the required components of the unit. <br> They can graph lines on the coordinate plane. They can locate <br> coordinates. They know the associated vocabulary (see above) |
| Setting the Stage | Distribute photo of two adjacent pits with visible artifacts/features at <br> different depths. How are we going to record the position of each <br> feature so that we know where they are 1) relative to each other <br> and 2) relative to the other artifacts and features at the site? |
| Directed Discussion Elicit from class that we need some sort of coordinate system. |  |
| Challenge the class to use an x-y system (they will fail). Allow |  |
| students to propose a third axis - if they are unable to do so, the |  |
| teacher will propose it. |  |

\(\left.$$
\begin{array}{ll}\text { Development } & \begin{array}{l}\text { Explain that in archaeology, one point is identified called the datum } \\
\text { (vocabulary digression, include other plurals from Latin formed } \\
\text { without -s). The ground is gridded (elicit from students the analogy } \\
\text { to the cartesian plane), and each grid is labeled with the } \\
\text { coordinates of its southwest corner. (Project or draw coordinate } \\
\text { grid, practice with } 3 \text { examples). The locations are also identified by } \\
\text { their distance below the ground. This gives us a third dimension. In } \\
\text { a 3-dimensional coordinate system, the analogy would be a new, z- } \\
\text { axis. }\end{array}
$$ <br>
Activity I <br>
Teacher places an object in the front of the class, at a height of <br>
about 4 feet. This works best in a classroom with 1 foot square <br>
tiles. This is our datum. Teacher elicits cardinal directions from <br>
students, then calls out several "squares" based on their position in <br>
relation to the datum (e.g., 3 feet west, 6 feet south, 1 foot below <br>
the datum) and calls on students to identify what is at that location <br>
(call coordinates for student's heads, or doorknobs, book bags, an <br>

object outside the window, etc.)\end{array}\right\}\)| Group students. They have an "archaeology fieldwork" problem: to |
| :--- |
| assign the proper coordinates to an object in another part of the |
| school, or near the school (examples: the back right leg of the |
| principal's desk, the trophy case, the bus stop, the top of the flag |
| pole, the door to a basement lavatory in the building across the |
| street, etc) Share answers on the board, and let groups check |
| each other. |
